Dear Ddup,

Thanks for interesting in Puli.

About security patches: Puli bark 6 is still based on Ubuntu Precise Pangolin LTS, kernel 3.8.3 thus I applied those security updates Ubuntu published for Precise. (Be sure they responded to all discovered vulnerabilities in time.) So, the concerned modules in Puli are up-to-date, despite of (according to Ubuntu's patching conventions,) they manifest their "old" version number.

To prevent incompatibilities, I did not upgrade to a newer kernel version in bark 6. The existing v3.01 is patched, of course.

For details, please take a look in the posts above where I listed the patches available for bark 5 (in the patch folder at www.smokey01.com/gjuhasz/Puli_bark5_final_Aug2014). The same set is built into bark 6 along with many new features. Don't hesitate to visit the above referenced or other testing sites to verify.

I decided to apply security patches in the future for Puli bark 6, too, until the official (Canonical) support for Precise LTS expires.

I would appreciate if you could share your experience with me.

FYI: I am writing this from a new Puli based on Trusty Tahr, kernel 3.14.20. Beta will be uploaded soon. Final version arrives by Christmas Eve.

Have fun!

Regards,

gjuhasz

Tested and confirmed that recent patches are installed in the previous version numbers.</p> <p>Now testing using Puli Bark 6 on multiple computers, Laptop HP6833US, Acer D150 netbook, Asus 1000HD netbook, Asus 1000HE netbook etc... All on a single USB boot thumb drive, Multiple full backups, multiple secure wifi routers used at different physical locations. I boot from USB thumb drive restore from backup for the computer being used, then select the desired secure router. All working well, and most amazing is the very tiny amount of space used on the thumb drive for all those full backups, Puli is unique in this regard.</p> <p>Thanks again for making and sharing such a remarkable and useful Puppy derivative.</p> <p>Ddup</p> |

Precise version should be kept available, would it possible to provide it again. don't do it for me, wait more demands. It's an idea (FFmpeg Included free of charge, no need to take corrective actions with precise version) As I have tabrapp in my multiboot pendrive, pull would be the Puppy precise player. Netsurf downloaded for a try with Puli 6.0.4 (where link is dead) Netsurf always ask me if I agree, I don't know, I don't understand what Netsurf asks. Yes I want Google, it's simple, isn't? kicked out!</p> |

Audio master is deactivated, capture too, microphone too, that has to be known, open retrovol, and make the necessary change. Puli was supported by gjuhasz up to 2015 and replaced by a Tahr version. Robert 123 gives the link to load it however. Personally I decide to run precise puppies beside tabrapp versions, because in fact in my computer that make a difference, more apps are available with precise (more apps where available with DPUUP Exprimno too) and that is what I am looking for. Precise is the version still in use for most of our french Puppies (Toopy, Tpton, and ASRI EDU 310). I will get help in my native language near the devs, is needed. Puli 3.8.3 is easy to install, and puppaves are running well, however saving in pull is a different process, that is what I am going to learn, to use it as a pull. PPM is working well. Wireless is easy using SNS. French keyboard, once chosen, kept active at reboot. I use laptops, because you can move in the house, our outside. Wireless then can be weak, I bought a dongle to be able to compute outside; I will check if a driver is available for puli. Elms for me is not a browser easy. I loaded on the fly a Seamonkey version but I was told not to use Seamonkey. I installed Firefox on a new pupsave. I am use to usb pendrives, so I installed pull as multiboot beside Tahr and Xenial puppies. Devs need help from users for and feed back for these just released versions. 3.8.3 provides Abiword and Gnumeric included, that is enough for me; I was working for the boss with EXCEL and Word. I am not loose with these too. I don't work typing at home, Puppy is just for pleasure, no need of Libre office.</p> |

The network tray icon becomes red while suspicious connections are active. They are logged in /var/log/suspicious_connections file. bark bark ok</p> <p>a. According to the profile name, Puli makes hackers crazy. It disables the network periodically to prevent their session become effective. Crazy would be too much Does that mean that other Puppies are not secured ???</p> <p>Passenger Pelo I don't ask him to repair the aircraft. Don't use him as a demining dog pleasease.</p> |

Unfortunately version is only 9.0.4. I must admit that Puli makes me some trouble with password and pupsave. My purpose is not at all to stole some private data in my own computer. To pass through the defence wall is funny... when I succeed.</p> <p>Any Puppy can enter Puli without any difficulty, open the main sfs for destroying everything inside, or include a spy application. It's a joke, I would not break a Puppy Linux with another one ... But I could Puli tries something different, that is nice, even if I don't really need to protect myself from external attacks (Attack pup was a similar Puppy as Puli) People wanting to know what Puli looks like before downloading and burn ISO on a CD or DVD, could look at the video done with pAVRecord. Downloading package Decibel from the PPM is the subject, but my goal was to show that pAVRecord does the job, when Simple Screen Recorder cannot be used. Simple-Screen-Recorder-Ddup-3.5.2.11.pet: 11 M can be used by Puli, Last news... "A következő szavak mellőzésre kerütek a keresési kifejezésből: pull Legálább egy keresendő szó meg kell adnod. Minden szótnak, a jökekaraktereket nem számítva, legalább 3 karakter és legfeljebb 14 karakter karakterből kell állnia." Puli is not made in Hungary, where does it come from, then ? USA, hum, I am sure NO.</p> |
